

ABSTRACT

A method includes receiving a genealogical data element and determining a rating, wherein the rating is associated with the genealogical data element.

The method also includes receiving a rating associated with a second genealogical data element; and using the rating associated with the second genealogical data element to adjust the rating associated with the genealogical data element to adjust the rating associated with the genealogical data element. An apparatus includes a genealogical data element and a rating, wherein the rating is associated with the genealogical data element and the rating is determined from a rating of a first genealogical data element and a rating of a second genealogical data element.
